

What is claimed is:

1. A guide wire comprising:

(a) a core wire formed with a mounting portion at a distal end portion; and

5 (b) a plurality of coil wires being fitted onto the mounting portion substantially in tandem, and having different mechanical properties, the adjacent coil wires being connected with each other at the corresponding ends thereof,

10 wherein one of the corresponding ends of the adjacent coil wires is formed into a tapered portion gradually reducing in outer diameter toward said end,

and wherein the other one of the corresponding ends is formed into a receiving end portion into which the tapered
15 portion is inserted.

2. A guide wire according to Claim 1, wherein the mounting portion of the core wire comprises:

(a) a plurality of transitional portions continuously
20 disposed in the axial direction, and reduced gradually in outer diameter toward the distal end; and

(b) a distal end portion continuously disposed distally from the most distal transitional portion, and formed into a plate shape,

25 wherein the taper ratio of the most proximal

transitional portion is larger than that of other transitional portions.

3. A guide wire according to Claim 1, wherein the coil
5 wire positioned on the proximal side out of the adjacent coil wires is formed with a tapered portion.

4. A guide wire according to Claim 1, wherein, the
pitches of the receiving end portion of the coil wire are
10 formed to be larger than those of the remaining portion thereof.

5. A guide wire according to Claim 1, wherein, the
length of the insertion of the tapered portion into the
15 receiving end portion is 2% to 40% of the whole length of the coil wire having a receiving end portion.

6. A guide wire according to Claim 1, wherein the most distal coil wire is formed of a radiopaque material.
